Abstract: This review discusses the present status of freshwater fish families – Cyprinidae, Danionidae, and Xenocyprinidae of suborder Cyprinoidei and their conservation status, threats to the species diversity and the community-based conservation across the western Himalayan region. The family Cyprinidae, the largest among freshwater fish, consists of over 1,840 species; whereas Danionidae includes 375 species and Xenocyprinidae comprises around 173 species globally. A total of 35 genera and 76 species have been reported from various rivers and streams of four Indian Himalayan states. Of these, 67 species are classified as ‘Least Concern’, four as ‘Vulnerable’, two as ‘Near Threatened’, and one as ‘Endangered’ species as per the IUCN Red List. Uttarakhand exhibits the maximum species count (63) followed by Jammu & Kashmir (47), Ladakh (38), and Himachal Pradesh (36). The major threats faced by freshwater fish are damming, habitat fragmentation, pollution, invasive species, and climate change. Consequently, modern policies and community-led conservation initiatives play a vital role in preserving these freshwater ecosystems.

Keywords: Community conservation, Cyprinidae, fish diversity, freshwater conservation, freshwater ecology, habitat, IHR, India, IUCN status, rivers.

Abbreviations: IHR—Indian Himalayan Region | IUCN—International Union for Conservation of Nature.

Editor: Subhrendu Sekhar Mishra, Zoological Survey of India, Gopalpur-On-Sea, Odisha, India.

Author details: NISHA CHAUHAN is a research scholar at the Department of Zoology, School of Applied and Life Sciences, Uttarakhand University, Dehradun, India. Her research focuses on the water quality, freshwater fishery and taxonomic study. DR. DHYAL SINGH works as associate professor at the Department of Zoology, Shri Guru Ram Rai University, Dehradun India. His research interests primarily focus on Freshwater Ecology, Fish and Fisheries, Phytoplankton and Benthic Ecology, with specialization in Limnology and Fisheries. DR. SHEFALEE SINGH works as the assistant professor at the Department of Zoology, School of Applied and Life Sciences, Uttarakhand University, Dehradun, India. Her research expertise lies in environmental toxicology, freshwater biodiversity conservation, zoopharmacognosy, and applied entomology.

Author contribution: NC—conceptualization, literature survey, data collection, data organization and curation, data analysis, and manuscript writing and preparation of the final manuscript. DS—conceptualization, development of the study framework, editing, supervision and mentorship. SS—coordination and supervision of the study, and critical review of the manuscript.

Acknowledgements: The authors are thankful to Department of Zoology, School of Applied and Life Sciences, Uttarakhand University, Dehradun, India for providing necessary facilities and institutional support to carry out this study.

INTRODUCTION

The Indian Himalayan region extends approximately 2,500 km from northern Pakistan to northeastern India, covering an area of about 750,000 km² with elevations ranging 300–8,000+ m (Rawal et al. 2013). The region is divided into three zones—Greater Himalaya (Himadri), Lesser Himalaya (Himachal), and Outer Himalaya (Shivalik)—that play a crucial role for ecological security, fertile land, water resources, biodiversity, and scenic landscapes (Dimri et al. 2021). The western Himalayan states of India includes Jammu & Kashmir, Ladakh, Uttarakhand, and Himachal Pradesh forming a mountainous region with rich and fragile freshwater ecosystems created by its snow-fed rivers, streams, and lakes (Choudhary et al. 2023). Major river systems such as Ganga River and Indus River sustain diverse fish communities, particularly carps and other Cypriniformes, as well as cold water hill-stream species including *Tor* (Mahseer) and *Schizothorax* (Snow trout) (Choudhary et al. 2023; Lata et al. 2026). Studies from various Himalayan rivers have documented species distribution across the altitude gradients, with species diversity increasing downstream due to deeper, broader and more environmentally diverse river channels (Ali et al. 2018; Das et al. 2020; Johnson et al. 2020).

The suborder Cyprinoidei Fitzinger, 1832, is a diverse group of freshwater fishes and divided into 12 families, including family Cyprinidae, Danionidae, and Xenocyprinidae, which comprise of freshwater fish species of carps, danionids and sharpbellies (or minnows) respectively (Van der Laan et al. 2026). According to ‘The ETYFish Project’ (Scharpf 2026) Cyprinidae family (carp or minnow), represents one of the largest and most diverse groups of freshwater fish with 172 genera and 1,840 species globally, particularly in Asia, Europe, and North America. The family Danionidae (danios) comprises 39 genera and 375 species, whereas the Xenocyprinidae (sharpbellies) includes 45 genera and 173 species/subspecies. They flourish in varied aquatic habitats, such as rivers, lakes and ponds, exhibiting remarkable adaptability and unique morphological traits like streamlined body, single dorsal fin, and small mouth suited for grazing algae and organic waste (Gidmark & Simons 2014). They play a crucial role in freshwater ecosystems by contributing to nutrient cycling and serving as prey for larger species (New World Encyclopedia 2008). Several cyprinids, danionids, and xenocyprinids are at risk due to habitat loss, hydropower, overfishing, pollution, invasive species, and climate change (Bhatt et al. 2023). To protect these ecologically significant fishes

and their habitats, conservation efforts are essential that emphasizes the need to address environmental degradation and promote sustainable practices (Nelson et al. 2016; Froese & Pauly 2026).

Fish studies in the Indian Himalayan Region (IHR) from past to present: a brief account

The initial prominent research on fishes in the IHR (Image 1) can be traced back to the late 19th and early 20th centuries, particularly highlighting the introduction of non-native species and the documentation of the local fish fauna. According to Burrard & Hayden (1933), the Himalayan rivers can be grouped into four distinct groups. The first one consists of the rivers in the eastern region, located between the Brahmaputra and Tista, referred to as the rivers of the Assam Himalaya. The second group includes the rivers situated between the Tista and the Kali, known as the Nepal Himalaya. The third group encompasses those rivers found between the Kali and the Sutlej, termed the Kumaon Himalaya. Finally, the last group consists of the rivers located west of the Sutlej, identified as the Punjab Himalaya (Burrard & Hayden 1933).

The discovery and documentation of fish diversity in the Indian Himalayas have spanned nearly two centuries. In the year 1838, Heckel first described 10 schizothoracin fish species from Kashmir (Von Hugel & Heckel 1838). Subsequent contributions include Menon’s work documenting 23 species from Kumaon, tabulating 92 torrential species across drainage systems, and compiling a list of 218 species from extensive surveys (Menon 1949, 1954). Das (1965) recognized 15 schizothoracin species from Kashmir, while Saxena (1968) reported 68 species from Jammu & Kashmir. Tilak (1967, 1990) detailed 38 species in the River Tawi, and Talwar (1977) discovered new *Gymnocypris* species during the Ladakh Expedition.

Current studies have expanded knowledge across Himalayan regions. Sivakumar (2008) studied the Indus River. Shrestha (2008) analyzed Nepal’s Himalayan waters. The regional evaluation includes Central Himalaya (Agarwal et al. 2019), Uttarakhand’s reservoirs (Tripathi 2020; Tomar et al. 2021; Uniyal & Uniyal 2021), and Kashmir’s River systems (Hussain & Rashid 2021; Awes et al. 2023). Recent studies by Choudhary et al. (2023) highlights the decline of native species like *Schizothorax richardsonii* and the rise of exotic species like *Cyprinus carpio* while Chaudhary et al. (2024) reported 16 species in river Asan, Uttarakhand, with cyprinids being the dominant group in both cases. This comprehensive research highlights the rich but vulnerable fish diversity

Image 1. The states of western Indian Himalayan Region.

of the Himalaya. Table 1 provides a record of suborder Cyprinoidei fish genera and species documented by various researchers from some major rivers and streams across states of western IHR, highlighting the diversity and distribution status of the fishes.

State-wise distribution of fishes species (family: Cyprinidae, Danionidae, and Xenocyprinidae) in western IHR

A state wise record detailing the distribution of various fish species belonging to the Cyprinidae, Danionidae, and Xenocyprinidae families has been presented here. The fauna of Jammu & Kashmir comprises of 47 species consisting of 30 cyprinids, 15 danionids, and two species of xenocyprinids with *Schizothorax richardsonii* (Gray, 1832) being the most abundant species (Table 2). Ladakh's fish fauna includes 38 species comprising 29 cyprinids, six danionids, and three xenocyprinids species (Table 3). In Uttarakhand, *Opsarius bendelisis* (Hamilton, 1807) is the most abundant among all 63 species recorded in the state's rivers comprising 40 cyprinids, 20 danionids, and three xenocyprinids (Table 4). Himachal Pradesh is the home to 36 species that includes 28 cyprinids and eight danionids but no xenocyprinid species (Table 5).

Present conservation status of fish species (family: Cyprinidae, Danionidae, and Xenocyprinidae) in western IHR

The IUCN Red List Categories and Criteria provide a widely recognized system for assessing species at risk of global extinction (Chandra et al. 2017). The current

conservation status as per IUCN Red List for cyprinids, danionids, and xenocyprinids reported in the IHR is presented as Table 6. This table depicts a total of 76 species in the suborder – Cyprinoidei recorded from the four western Himalayan states of India comprising 50 species belonging to the family Cyprinidae, 23 species of the family Danionidae, and three species of the family Xenocyprinidae. Among these species, only one species, *Tor putitora*, falls under the 'Endangered' (EN) category. Four species, namely, *Naziritor chelynoides*, *Schizothorax richardsonii*, *S. plagiostomus*, and *S. esocinus*, are categorized as 'Vulnerable' (VU). Two species are listed as 'Near Threatened' (NT), four as 'Data Deficient' (DD), three as 'Not Evaluated' (NE), while the remaining 62 species belong to the 'Least Concern' (LC) category.

Conservation of fish diversity in western IHR

To conserve fish diversity in the Indian Himalayan region, several strategies have been proposed. Protecting and restoring habitats is critical, requiring measures to reduce pollution and manage water resources effectively (Singh 2016). Engaging local communities through community-based management can encourage sustainable practices, empowering them to monitor fish stocks and protect habitats. Constant research and monitoring are crucial for understanding ichthyofaunal diversity, identifying critical habitats, and tracking population changes to guide flexible management. Reinforcing legislation and policy frameworks is also crucial, including tougher guidelines on fishing practices, habitat destruction, and establishing protected areas.

Table 1. List of recorded fish species (suborder Cyprinoidei; family Cyprinidae, Danionidae, and Xenocyprinidae) in states of western Indian Himalayan Region.

Also, educational programs and awareness campaigns can highlight the importance of fish diversity and encourage sustainable practices that support both ecosystems and local communities (Suski & Cooke 2007; EIA EMP Report of Lakhwar Multipurpose Project 2020).

Traditional conservation methods

For generations, the Himalayan communities have used traditional fish conservation methods integrated in cultural practices and community-led initiatives to preserve aquatic biodiversity. Cultural and religious beliefs, such as bans on fishing during specific periods by Buddhist sects or in sacred places, plays a vital role in protecting threatened species and maintaining

ecological balance (Gupta et al. 2016). There are over 30 temple-based fish sanctuaries, established near temples or shrines to honor the fish deity, Matsya avatar (first incarnation of Vishnu), in various Indian states and some are present in Uttarakhand and Himachal Pradesh, with ancient traditions like offering mahseer fish to honor ancestors further reinforcing conservation efforts (Jumani et al. 2023). Furthermore, sustainable fishing techniques minimize environmental impact and support healthy fish populations (Srivastava et al. 2002).

Threats to the fish diversity

The ichthyofaunal diversity in the Himalayan states of India faces severe threats from habitat degradation,

overfishing, pollution, invasive species and climate change. Human activities like dam construction, deforestation and water diversion lead to fragmentation of aquatic ecosystems, disrupting fish migration and spawning. Contaminants from agricultural runoff, domestic waste and industrial effluents deplete oxygen levels, reducing species richness. Unsustainable practices and overfishing further reduces populations, while invasive species out-compete native fishes, altering ecosystems. Moreover, climate change exacerbates these challenges by disturbing spawning cycles and threatening cold-water species. These dangers draw attention to the urgent need for conservation measures to protect Himalayan aquatic biodiversity (Raina & Petr 1999; Negi 2010; Mishra et al. 2011; Dash et al. 2020; Malik et al. 2020; Bhatt & Manish 2023; Pandey et al. 2023).

CONCLUSION

This paper examines the diversity of Cyprinidae, Danionidae, and Xenocyprinidae fish families (Suborder Cyprinoidei) present in the India's western Himalayan states. The observations showed that out of all four states Uttarakhand hosts the highest diversity of Cyprinidae species, followed by Jammu & Kashmir, Ladakh, and Himachal Pradesh. The data of 57 rivers and streams that flows across these Himalayan states have been analyzed revealing that the Ramganga River in Uttarakhand exhibits the highest genus as well as species diversity. The Ganga River system and the Indus River system form the major drainage systems in northern India, highlighting the region's rich aquatic biodiversity. While rivers like Spiti and Parbati in Himachal Pradesh and Kishanganga and Sind in Jammu & Kashmir recorded the lowest species diversity. The diversity typically increases downstream or at lower altitude. Most of the recorded species are still categorized as Least Concern but several important endemic species such as snow trout and mahseer remains under threat. Furthermore, the degradation of freshwater ecosystems due to various human-induced threats such as urbanization, water pollution and over-fishing shows a negative impact on the fish population and highlights the need for habitat focused conservation in this Himalayan region.

Reviewers 2021–2023

Due to pausity of space, the list of reviewers for 2021–2023 is available online.

The opinions expressed by the authors do not reflect the views of the Journal of Threatened Taxa, Wildlife Information Liaison Development Society, Zoo Outreach Organization, or any of the partners. The journal, the publisher, the host, and the partners are not responsible for the accuracy of the political boundaries shown in the maps by the authors.

Print copies of the Journal are available at cost. Write to:
The Managing Editor, JoTT,
c/o Wildlife Information Liaison Development Society,
3A2 Varadarajulu Nagar, FCI Road, Ganapathy, Coimbatore,
Tamil Nadu 641006, India
ravi@threatenedtaxa.org & ravi@zooreach.org

Journal of Threatened Taxa is indexed/abstracted in Bibliography of Systematic Mycology, Biological Abstracts, BIOSIS Previews, CAB Abstracts, EBSCO, Google Scholar, Index Copernicus, Index Fungorum, JournalSeek, National Academy of Agricultural Sciences, NewJour, OCLC WorldCat, SCOPUS, Stanford University Libraries, Virtual Library of Biology, Zoological Records.

NAAS rating (India) 5.64

OPEN ACCESS

The Journal of Threatened Taxa (JoTT) is dedicated to building evidence for conservation globally by publishing peer-reviewed articles online every month at a reasonably rapid rate at www.threatenedtaxa.org. All articles published in JoTT are registered under [Creative Commons Attribution 4.0 International License](https://creativecommons.org/licenses/by/4.0/) unless otherwise mentioned. JoTT allows unrestricted use, reproduction, and distribution of articles in any medium by providing adequate credit to the author(s) and the source of publication.

Articles

Knowledge and attitude towards wild carnivores among university students: a study from Kargil Trans-Himalaya, India
– Iftikar Ali & Robert John Young, Pp. 29559–29570

Avian community structure in a human-impacted forest landscape: insights from Amargarh Tiger Reserve, Uttar Pradesh, India
– Vijay Pratap Singh, Sajid Reza, Sharad Kumar, Meraj Anwar & Afifullah Khan, Pp. 29571–29582

Long-term dynamics of breeding waterbirds in relation to habitat structures in a tropical irrigation wetland: evidence from Vettangudi Bird Sanctuary, Tamil Nadu, India
– H. Maitreyi, N. Raveendran, Reshmi Vijayan & H. Byju, Pp. 29583–29595

Avifaunal diversity with reference to their feeding guilds of Mahadare Conservation Reserve, Maharashtra, India
– Riya Patil, Gayatri Pawar, Neha Bendre, Aruna Shelar & Sunil Bhoite, Pp. 29596–29605

Nesting colonies and breeding ecology of the Cattle Egret *Bubulcus ibis* (Linnaeus, 1758) in northern and northeastern Bangladesh
– Allama Shibli Sadik, M. Monirul H. Khan, M. Kamrul Hasan, Fahad Hossain Haider & M. Sher-E-Afgan, Pp. 29606–29616

An annotated checklist of the avifauna of Pichavaram Mangrove Forest, southern India: a Ramsar wetland with conservation significance
– I. Jamil Hussain & K. Jahir Hussain, Pp. 29617–29629

Snake diversity based on rescue records in urban Jaipur, Rajasthan, India
– Aadya Kalra, Dharampal Singh & Joy Gardner, Pp. 29630–29638

Assessment of ichthyofaunal diversity of the suborder Cyprinoidei Fitzinger, 1832 (Actinopterygii: Cypriniformes) of western Indian Himalayan Region: present status and conservation - a systematic review
– Nisha Chauhan, Dhyal Singh & Shefalee Singh, Pp. 29639–29652

Post-impoundment changes in fish diversity and community structure of the Dikrong River, Arunachal Pradesh: a comparative assessment between 2000–2001 and 2025–2026
– Minam Siram, Tonya Miroh, Rafia Farooquee & Debangshu Narayan Das, Pp. 29653–29666

An annotated district-wise account of Odonata (Dragonflies and Damselflies) from Uttarakhand, India
– Manoj Kumar Arya & Mayank Mahara, Pp. 29667–29683

Study of Odonata in the coastal-influenced area of Purba Medinipur District with a note on seasonal fluctuations and species composition
– Suvabrata Khatua, Sriparna Jana, Sourav Bar & Sudipta Kumar Ghorai, Pp. 29684–29699

Species richness and distribution of Hymenophyllaceae in Mindanao Island, Philippines
– Aurfeli D. Nietes, Rachel C. Sotto, Analinda C. Manila-Fajardo, Lerma S.J. Maldia, Fulgent P. Coritico, Victor B. Amoroso & Inocencio E. Buot Jr., Pp. 29700–29715

Communications

Assessment of genetic variation for conservation implications in the Critically Endangered Bawean Deer *Axis kuhlii* Temminck, 1836 (Mammalia: Artiodactyla: Cervidae)
– Frank Drygala, Alain C. Frantz, Gono Semiadi, Jörg Mehnert, Agus Ariyanto, Yul Ianto & Wirda Teti, Pp. 29716–29720

First record of interspecific allopreening among *Gyps* vultures in the Aravalli Range, India
– Hemsingh Gehlot, Anil Kumar Sharma & Narayan Lal Choudhary, Pp. 29721–29728

DNA Barcode based species delineation within Freshwater Garfish *Xenentodon cancila* (Hamilton, 1822) (Belontiiformes: Belontiidae) reveals the existence of multiple lineages under single nominal taxon
– Ranjit More, Jiwan Sarwade, A. Shabnam & K.P. Dinesh, Pp. 29729–29735

Characterization of *Aphelenchoides confusus* Thorne & Malek, 1968 (Nematoda: Rhabditida: Aphelenchoididae) occurring in a marine habitat of eastern India
– Sujit Das & Sudipta K. Ghorai, Pp. 29736–29742

Geo-ecological dynamics of Bhairabkunda Grasslands: flood origins, florican dependence, and conservation need
– Jonmani Kalita, Karishma Sharma Chamlagain, Koushik Rajbongshi & Dhritiman Das, Pp. 29743–29750

Viewpoint

Schedule III of the Wild Life (Protection) Amendment Act, 2022: a new legal shield for India's threatened plant species
– Monalisa Dey & Avishek Bhattacharjee, Pp. 29751–29758

Short Communications

A century-long hiatus: rediscovery of Cadorna's Pipistrelle *Hypsugo cadornae* (Chiroptera: Vespertilionidae) from India
– Uttam Saikia & Gabor Csorba, Pp. 29759–29763

Photographic record of the Painted Bat (Chiroptera: Vespertilionidae: *Kerivoula picta* (Pallas, 1767)) from the Terai Region of Uttar Pradesh, India
– Deval Kadam, Ravi Rohit, Vipin Kapoor Sainy, H. Rajamohan, R. Jagdeesh, Mudit Gupta & Manish Singh, Pp. 29764–29768

New record of the Indian Roofed Turtle *Pangshura tecta* (Gray, 1831) (Reptilia: Testudines: Geoemydidae) from Jaisamand Lake, Rajasthan, India
– Vijay Kumar Koli, Nirbhay Singh Chouhan, Kamal Vaishnav & Rakesh Kumar, Pp. 29769–29771

Observations on the dental morphology of the North African Sandfish *Scincus scincus* (Squamata: Scincidae)
– Shreya Bhattacharya & Indraneil Das, Pp. 29772–29775

New distribution records of two *Lithurgus* bee species (Hymenoptera: Megachilidae) from Jammu & Kashmir, India
– P.M. Osman Javid & Sajad H. Parey, Pp. 29776–29780

Notes

Striped Hyena *Hyaena hyaena* (Linnaeus, 1758) carrying a carcass of a Rusty-spotted Cat *Prionailurus rubiginosus* (I. Geoffroy Saint-Hilaire, 1831) in Rajasthan, India
– Akshay Jain, Debashish Panda, Rajasekar Rajaraman, Sanjeev Sharma, Sugna Ram Jat & Kamlesh K. Maurya, Pp. 29781–29783

Toil in the soil: putative nest excavation by an adult female Panther Chameleon *Furcifer pardalis* (Cuvier, 1829) in moist, clayey soil on Nosy Komba, Madagascar
– Hinrich Kaiser & Przemysław Zdunek, Pp. 29784–29786

***Amomum pauciflorum* Baker (Zingiberaceae), an addition to the flora of Manipur, India**
– Lolia Hepuni, Adani Lokho & A.A. Mao, Pp. 29787–29790
