Abstract: Macrobrachium myanmarum sp. nov. was found from near Min Kun (local name Min Gon) at Mandalay, Ayeyawady (Irwawaddy) River (22.043N & 96.043E), Myanmar. It is a small-sized prawn showing close relation with Arachnochium kulsiense (Jayachandran et al. 2007) and A. mirabile (Kemp 1917). This species can at once be identified from both the species by the characters: medium-sized and highly-elevated and arched rostrum, extending as far as distal segment of antennular peduncle or behind, upper margin with 11–15 teeth of which three (rarely 4) teeth post-orbital; ventral margin without teeth (rarely one); second chelate legs unequal, right leg larger (sometimes left); major leg in which carpus with proximal part narrow and distal end broadened, subequal to merus, palm and fingers; propodus slightly more than the combined length of merus and carpus; fingers very slender, almost equal to palm, fixed finger a bit shorter than movable finger, cutting edges with 2–6 weak denticles at proximal cutting edges, distal denticle situated at about 1/3rd distance from base; ischium, merus, carpus, propodus, palm and dactylus in the ratio 9.62 : 19.25 : 24.06: 47.06 : 23.53 : 23.53, respectively (related to the total length of pereopod); minor leg with minute tubercles in larger specimens; ischium, merus, carpus, propodus, palm and fingers in the ratio 13.1 : 23.68 : 22.37 : 40.8 : 15.8 : 25.0, respectively (related to total length of pereopod); palm slightly swollen and shorter than fingers, fingers slender and curved with a wide gap when closed. Maximum size recorded for the species is 56mm male and 44mm female.

Keywords: Identification, Macrobrachium myanmarum sp. nov., Min Kun, palaemonid prawn.

Taxonomic studies on palaemonid prawns of Myanmar were carried out by De Man (1888), Henderson (1893), Schenkel (1902), De Man (1905, 1906), Rathbun (1910), De Man (1911), Kemp (1917, 1918, 1925), Tiwari (1949), Holthuis (1950), Tiwari (1952, 1958), Holthuis (1980), Naiyanetr (1980), Jayachandran (2001), Cai & Ng (2002), Cai et al. (2004), Hla Phone & Suzuki (2004), Short (2004), Mie et al. (2009), Wowor & Ng (2010), Mar & Myint (2014), Khin et al. (2018), and Mar et al. (2018) have reported 40 species, namely, Arachnochium mirabile (Kemp), Exopalaemon styliferus (Kemp), Leptocarpus fluminicola (Kemp), Macrobrachium oemulum (Nobili), M. assamense (Tiwari), M. australiensis M. birmanicum (Schenkel), M. cavernicola (Kemp), M. clymene (De Man), M. dayanum (Henderson), M. hendersoni (De Man), M. hildebrandti (H.M.Edwards), M. idella (Hilgendorf), M. johnsoni Ravindranath, M. joppae Holthuis, M. josephi Jayachandran, M. lamarrei (H.M.Edwards), M. lanatum Cai & Ng, M. lanceifrons (Dana), M. lancasteri (DeMan), M. iar (Fabricius), M. latidactylus (Thallwitz), M. latimanus (von Martens),

Macrobrachium myanmarum sp. nov. Myo et al.

Materials and Methods

Seventeen specimens (eight males and nine females) were collected from Min Kun at Mandalay, Ayeyarwady River (22°2'.37"N & 96°2'.37"E), Myanmar, on 29 July 2018 and 10 June 2020 (Image 1). Holotype deposited at referral center of Central Marine Fisheries Research Institute (ICAR CMFRI), Kochi, Kerala, India (CMFRI DNR No. ED.2.2.1.6); 4 females deposited at Regional Centre of ICAR NBFGR, Kochi, Kerala, India.

The specimens were identified based on the relevant literature on Palaemonid prawns (De Man 1888; Henderson 1983; Schenkel 1902; De Man 1905, 1906; Rathbun 1910; De Man 1911; Kemp 1917, 1918, 1925; Tiwari 1949; Holthuis 1950, 1955; Holthuis 1980; Naiyanetr 1980; Liu et al. 1990; Jayachandran 2001; Cai & Ng 2002; Cai et al. 2004; Short 2004; Hla Phone & Suzuki 2004; Komai & Fugita 2005; Jayachandran et al. 2007; Liu et al. 2007; Mie et al. 2009; Wowor & Ng 2010; Khin et al. 2018).

Infraorder: Caridea Dana, 1852
Superfamily: Palaemonoidea Rafinesque, 1815
Family: Palaemonidae Rafinesque, 1815
Subfamily: Palaemoninae Rafinesque, 1815
Genus: Macrobrachium Spenze Bate, 1868

Macrobrachium myanmarum sp. nov. (Figures 1–3; Image 3)

Synonym: non Macrobrachium kulsiense Khin et al., 2018.

Materials examined

Holotype: Deposited at ICAR CMFRI referral museum, Kochi, Kerala, India with registration number - CMFRI DNR No. ED.2.2.1.6, male, Collected by Dr.H.H.S. Myo & Dr.K.L.Khin from Min Kun at Mandalay, Ayeyarwady River, Myanmar (22°2'.37"N & 96°2'.37"E) on 29.07.2018
Paratypes: 4 females, Collected from Min Kun by Dr. H.H.S. Myo & Dr. K.L.Khin on 29.07.2018 at Mandalay, Ayeyarwady River (22°2'.37"N & 96°2'.37"E), Myanmar has been utilized for molecular studies at Regional Centre of ICAR NBFGR, Kochi, Kerala, India. Remaining paratypes (males and females) collected from same locality on 29.07.2018 and 10.06.2020 in the personal collection of Dr. H.H.S. Myo at Department of Zoology.

Measurements (mm): Holotype (male): 56.0 TL, 24.0 CL; Paratypes: males 37.0 TL, 15.0 CL; 40.0 TL, 15.0 CL; 41.0 TL, 16.0 CL; 42.0 TL, 16.0 CL; 48.0 TL, 19.0 CL; 50.0 TL, 21.0 CL; 52.0 TL 21.5, CL; 56.0 TL, 24.0 CL; (females): 34.0 TL, 15.0 CL; 37.0 TL, 13.0 CL; 37.0 TL, 13.0 CL; 38.0 TL, 16.0 CL; 39.0 TL, 16.5 CL; 41.0 TL, 18.0 CL; 42.0 TL, 16.0 CL; 42 TL, 17.0 CL; 44.0 TL, 18.0 CL

Etymology:
The species name is in honour of the country from where this new species has been collected and documented.

Diagnosis

Macrobrachium having the medium-sized, highly-elevated and arched rostrum, extending as far as distal segment of antennular peduncle or behind, upper margin

Image 1. Collection station - Min Kun from Ayeyarwady (Irrawaddy) River, Myanmar
Macrobrachium myanmarum sp. nov.

Description

Rostrum medium-sized, extending as far as distal segment of antennular peduncle or behind, highly elevated and arched and tip directed forwards (in younger specimens rostrum less elevated), upper margin with 11–15 teeth of which three teeth (rarely 4) behind the orbit, proximal most and second teeth more widely separated than the remaining series teeth of uniform distance between them, proximal six teeth anteriorly directed and remaining teeth directed upwards, thick and long bunches of setae present in between teeth; ventral margin curved upwards, one minute tooth in holotype at the level of 10th dorsal tooth (generally absent); setae longer and closely set in both upper and lower margins (Figs. 1 A,B Image 2,4).

Carapace generally smooth but with small tubercles on antero-lateral side, about 43.0 per cent of total length, orbit sunken, antennal spine sharp, not placed at edge; hepatic spine sharp; a distinct groove present below hepatic spine, pterygostomian region not sharp (Figs. 1A,B Image 2,4).

Eyes developed. Telson slender, distal end sharply pointed and extends as far as or beyond the level of the outer spine of uropodal exopod; upper margin with two pairs of feeble spines, proximal pair situated at about 53 per cent and not in a line and distal pair closer to proximal pair (76 per cent), distal end with two pairs of spines, outer pair smaller and inner pair slender, longer and sharp, eight long plumose setae present in between the inner pair of spines (Fig. 3B).

Antennular peduncle three segmented, extends as far as 1/3rd of merus of major second cheliped and beyond merus of minor second legs, middle segment shortest, antero-lateral spine of basal segment reaches beyond middle but not to tip of 2nd segment of antennular peduncle (Fig. 1 D); disto-lateral spine of antennal scale with 11–15 of which three (rarely 4) teeth post-orbital; ventral margin generally without teeth (rarely with one); second chelate legs unequal, right leg larger (sometimes left leg); major leg in which carpus with proximal part narrow and distal end broadened, subequal to merus, palm and fingers; propodus slightly more than the combined length of merus and carpus; fingers very slender, almost equal to palm, fixed finger a bit shorter than movable finger, cutting edges with 2–6 weak denticles at proximal cutting edges, distal denticles at about 1/3rd distance from base; ischium, merus, carpus, propodus, palm and dactylus in the ratio: 9.62: 19.25: 24.06: 47.06: 23.53: 23.53 respectively (related to total length of pereopod); minor leg with tubercles in large specimens; ischium, merus, carpus, propodus, palm and fingers in the ratio 13.1: 23.68: 22.37: 40.8: 15.8: 25.0, respectively (related to total length of pereopod); palm swollen and slightly shorter than fingers.
Macrobrachium myanmarum sp. nov.

Myo et al.

sharply pointed, subdistal in position and extends just in front of distal end of merus of 2nd cheliped (Fig. 1E).

First chelate legs slender, extends up to tip of antennal scale; ischium slightly broader; merus slender; carpus 1.60 times longer than propodus; palm cylindrical, 1.3 times longer than fingers; fingers slender, equal sized with tufts of setae on outer margin (Fig. 2B).

Second chelate legs with tubercles in bigger specimens, unequal, right leg larger (sometimes left); major leg 1.7 times the size of total length and 2.4 times the size of minor leg; ischium flat; merus cylindrical; carpus with proximal part narrow and distal end broadened, subequal to merus, palm and fingers;
Macrobrachium myanmarum sp. nov. Myo et al.

propodus with maximum width at distal palm and slightly more than the combined length of merus and carpus; fingers very slender almost equal to palm, fixed finger a bit shorter than movable finger, movable finger curved, cutting edges with 2–6 weak denticles at proximal cutting edges, distal dactylus at about 1/3rd distance from base; ischium, merus, carpus, propodus, palm and dactylus in the ratio 9.62: 19.25: 24.06: 47.06: 23.53: 23.53, respectively (related to total length of pereopod) (Fig. 2D, Image 3). Minor leg with tubercles in larger specimens; ischium, merus, carpus, propodus, palm and fingers in the ratio 13.1: 23.68: 22.37: 40.8: 15.8: 25.0, respectively (related to total length of pereopod); palm swollen and slightly shorter than fingers; fingers slender with a wide gap when closed (Fig. 2C, Image 3).

Three pairs of non-chelate legs nearly equal sized, slender, smooth, not reaching beyond antennular scale when extended, propodus subequal to merus, carpus subequal to dactylus; dactylus slender sharply pointed, curved distally; ischium, merus, carpus, propodus and dactylus of third pair in the ratio 13.1: 23.68: 22.37: 40.8: 15.8: 25.0, respectively (related to total length of pereopod); palm swollen and slightly shorter than fingers; fingers slender with a wide gap when closed (Fig. 2C, Image 3).

Table 1 provides detailed morphometric measurements of the specimens.

Females: Carapace smooth, about 43 per cent to total length (average) (Fig. 1 B). Second pereopods slender, smooth, equal sized with ischium, merus, carpus, propodus, palm and dactylus in the average ratio 16.8: 26.0: 21.6: 35.7: 17.9: 18.4, respectively; palm subequal to fingers and without even traces of denticles on cutting edges (Fig. 2A). The non-chelate legs slender, segments in the average ratio 13.8: 27.5: 13.8: 28.6: 16.3, respectively. Fecundity 120 eggs (42 mm in total length).

Variation in growth: Young specimens: rostrum not much elevated as in adult, second chelipeds slender, without tubercles below the size of total length up to 48mm (Fig. 1 C). Male (big sized 56.0mm sized – recently collected): second pereopods unequal, major leg 2.4 times longer than minor leg; ischium, merus, carpus, palm and dactylus in the ratio 9.62: 19.25: 24.06: 47.06: 23.53: 23.53, respectively (related to total length of pereopod) (Fig. 2D, Image 3). Minor leg with tubercles in larger specimens; ischium, merus, carpus, propodus, palm and fingers in the ratio 13.1: 23.68: 22.37: 40.8: 15.8: 25.0, respectively (related to total length of pereopod); palm swollen; fingers subequal and very slender, movable finger longer and slightly curved and with six small denticles of which distal one roughly 1/3rd distance from the base; minor leg with ischium, merus, carpus, palm and fingers in the ratio 14.10: 23.08; 21.79: 15.38: 25.64, respectively; palm swollen; fingers slender and curved with a wide gap when closed; palm and fingers possess stiff long setae (Image 3). Variations in the growth is shown in image 4.

Table 1 provides detailed morphometric measurements of the specimens.

Colouration: Body generally bluish coloured with red setae (Fig. 3A).

Distribution: Ayeyarwady River at Mandalay, Myanmar.

Remarks

The new species is closely related to *Arachnochium kulsense* (Jayachandran, Lal Mohan & Raji, 2007) and *A. mirabile* (Kemp, 1917). *M. myanmarum* sp. nov. is characterized by the presence of a medium sized highly elevated rostrum which extends as far as the distal segment of antennular peduncle or behind. The dorsal margin is curved with 11–15 of which 3 (rarely 4) post-orbital in position. Branchiostegal groove extending slightly behind hepatic spine. The second pereopods are unequal. The major legs 1.7 times longer than the total length and 2.4 times the total length of minor leg. The fingers of major leg are slender and almost equal to palm and bear two to six minute denticles at proximal cutting edges of which the distal denticles situated at about 1/3rd distance from base whereas in the minor leg the palm is swollen and subequal to fingers and carpus. In large males the fixed finger is a bit smaller than movable finger and movable finger curved. It possesses large number of eggs. In *A. kulsense* rostrum is long which extends as far as the tip of antennal scale and the upper margin highly elevated with 9–12 teeth of which two or three are post-orbital in position. The second cheliped in which palm is shorter than fingers and carpus. It possesses a few large eggs (up to 20). *A. mirabile* is characterized by a highly elevated short rostrum with a formula of 13–16 of which 4–6 teeth post-orbital in position and 1–2 ventral teeth. Dorsal teeth not uniformly spaced. Branchiostegal suture not extending behind hepatic spines. Second pereopods subequal in length and similar in form with palm subcylindrical, fingers slender and much longer than palm and without denticles on the cutting edges, chela 1 ¾ times as long as carpus, palm swollen, smooth and less than ¾ as
long as carpus. The present new species can at once be identified on the basis of its highly elevated curved rostrum with specific rostral formula and also nature, proportion of segments, ratio between carpus, palm and fingers of major leg and denticles on cutting edges. Fifth pleura of abdomen is unlobed as in the genus. A comparison of characters of related species is given in Table 2. Morphological variations during growth are shown in image 4.

The very slender fingers of the major second chelate leg of the present species shows some resemblance with that of M. lar (Fabricius, 1798). The rostral formula and general shape of the rostrum of the two species differ considerably. In M. lar chela is 3.5 times as long as carpus and palm of uniform thickness and longer than to twice as long as carpus. Carpus is shorter than merus. In the present new species chela is about 2.0 times as long as carpus and palm shorter than carpus and distal region with maximum thickness. Carpus longer than merus (Chace & Bruce 1993).

Wwowor & Ng (2010) have created a new genus, namely, Arachnochium, to accommodate M. mirabile and M. kulsense. This new genus is characterized by the presence of elongated fourth and fifth pereiopods, large blunt tip triangular median process on T4, without transverse plate in T5, without wide median process in T8, bilobed nature of postero-lateral region of fifth abdominal pleura and longer inner spine on exopod of uropod. The present new species does not possess any of the above characters and hence it is appropriate to retain it in the genus Macrobrachium Bate, 1868

Khin et al. (2018) have reported M. kulsense Jayachandran, Lal Mohan & Raji (= A. kulsense) from Myanmar and is a misidentifications.
