Manipur is one of the northeastern states of India lying between 94.31–94.78 E longitudes and 23.83–25.68 N latitude. The state is bounded by upper Chindwin areas of Myanmar in east, Cachar hills of Assam in west, Naga Hills of Nagaland in the north and Chin hills of Myanmar in the south. The state is also a part of the Indo-Burma Biodiversity Hotspot.

The genus *Melastoma* of family Melastomataceae is distributed in southeastern Asia, India, southern China, Japan, northern Australia, Oceania, and Bangladesh. It was reported to comprise about 100 species (Chen 1984), however recent taxonomic revision recognized 22 species (Meyer 2001). While in flora of British India (Vol 2), the genus is represented by six species, viz., *M. malabathricum*, *M. polyanthum*, *M. normale*, *M. imbricatum*, *M. sanguineum*, and *M. houtteanum* (Hooker, 1889), in flora of Manipur (Vol 1), it is represented by two species, viz., *M. malabathricum* and *M. normale* (BSI 2000). And three species were recorded in flora of Assam (Vol 2), viz., *M. malabathricum*, *M. normale*, and *M. imbricatum* (Kanjilal et al. 1938). Among the three species reported from northeastern region (NER) of India, *M. normale* is now designated

as *Melastoma malabathricum* ssp. *normale* (D. Don) K. Meyer.

A field survey was carried out at Ukhrul district, Manipur during the month of April 2021. A plant was collected from Lambui (25.015N, 94.294E), Ukhrul district, Manipur which looked similar to *M. malabathricum*. In flora of Manipur (2000), *M. malabathricum* was reported from Sirohee, Imphal, and Uchathol in Manipur. However, the leaves were found to be broader with longer petiole. The plant specimen was brought to Plant Systematic and Conservation Laboratory, Institute of Bioresources and Sustainable Development (IBSD), Imphal, India for proper identification. With the help of floras (Hooker 1889; Kanjilal et al. 1938; Wu et al. 2007), and Literatures (Meyer 2001), the plant specimen was identified as *Melastoma imbricatum* Wallich ex Triana of family Melastomataceae using distinct characters such as hypanthium covered with short appressed golden scales; petiole 1.8–6.5 cm, lamina strigose on both sides, leaf blade broadly ovate to broadly elliptic, 5.5–13.5 cm wide; ovary as long as hypanthium. The herbarium specimen was deposited at Plant systematic and Conservation Laboratory, Institute of Bioresources

Since no previous report was found on distribution of *M. imbricatum* in Manipur, India, the present study reports it as a new addition to the flora of Manipur, India.
