Abstract: Protected areas (PAs) in Terai-Arc landscape are relatively poorly explored as far as bird communities are concerned. Here we report a checklist and significant records of birds recorded during opportunistic observations and systematic bird surveys in four PAs: Katerniaghata Wildlife Sanctuary (2001–2004, 2006, 2008, and 2015); Pilibhit Tiger Reserve (2014–15); Valmiki Tiger Reserve (2014–17), and Udaipur Wildlife Sanctuary (2018). We have compiled a checklist of 424 species that includes 358 species in the Katerniaghata Wildlife Sanctuary, 306 species in the Valmiki Tiger Reserve, 236 species in the Pilibhit Tiger Reserve, and 128 species in Udaipur Wildlife Sanctuary. Most species belong to the Insectivore guild (190 species, 44.8%), while the nectarivorous guild was the least represented (10 species, 2.3%). A total of 9% of species in the region were either globally threatened (6 Critically Endangered, 5 Endangered, and 8 Vulnerable) or Near Threatened (19 species). Sightings of species of conservation importance have been discussed.

Keywords: Bird diversity, Critically Endangered, globally threatened, Katerniaghata Wildlife Sanctuary, Pilibhit Tiger Reserve, species richness, Udaipur Wildlife Sanctuary, Valmiki Tiger Reserve.

INTRODUCTION

The Terai-Arc landscape is a part of the Terai-Duar Savanna Eco-region, between River Bagmati (Nepal) to the Yamuna (India) spreading over an area of 30,000 km². In India, the region runs parallel to the foothills of the Himalayas encompassing the Shivalik hills, the Bhabar tract, and the Terai plains (Rodgers & Panwar 1988). Once covered with a continuous mosaic of dense forest and tall grassland, the natural vegetation of the region today exists amid human habitation and agricultural land (Johnsingh et al. 2004). The natural vegetation is being conserved and managed under four national parks (NP): Rajaji NP, Corbett NP, Dudhwa NP, and Valmiki NP, along with five wildlife sanctuaries (WS): Sonanadi WS, Kishanpur WS, Katerniaghāt WS, Suhelwa WS, and Sohagibarwa WS, which sustain birds and mammals representing Himalayan and Gangetic plain affinities along with many species of national and international importance (Rahmani et al. 1989; Pandey et al. 1994; Chanchani et al. 2014).

Protected areas (PAs) of the Terai-Arc landscape have been explored relatively less as far as bird communities are concerned. Previous research on avifauna was either to assess community structure and status of particular groups or species and has been restricted to limited PAs of this landscape. Pandey et al. (1994) assessed the bird community structure of Rajaji NP. Dhakate et al. (2008) and Kidwai et al. (2013) highlighted the status of water birds and terrestrial birds of Corbett NP respectively. Rahmani et al. (1989) and Javed et al. (1999) determine the status of Bengal Florican *Houbaropsis bengalensis* and Swamp Francolin *Francolinus gularis*, respectively, in Dudhwa NP. Maheswaran & Rahmani (2005) studied the breeding biology of Black-necked Stork *Ephippiorhynchus asiaticus* in Dudhwa NP. Kalam (2005) and Sethy & Chauhan (2011) conducted studies to look at avian diversity in Katerniaghāt WS. Very few ornithological studies have been carried out in the Valmiki Tiger Reserve (TR) (Sinha 2012; Choudhury 2016). Hence avifaunal composition of many PAs of the Terai-Arc landscape is not known hitherto and it is therefore desirable to understand the avifaunal composition to bridge the knowledge gap.

STUDY AREA

Avifaunal surveys were carried out in Pilibhit TR and Valmiki TR, and Katerniaghāt WS, and Udaipur WS. These PAs are situated on the Indo-Nepal border in Uttar

Pradesh and Bihar (Figure 1).

Katerniaghāt WS (KWS) (27.916–28.416 °N, 81.000–81.416 °E) covers an area of 400.09 km² and is located in the Upper Gangetic plain in the Terai of Bahraich district, Uttar Pradesh, India (Figure 1). KWS was declared as a wildlife sanctuary in 1976. It is connected with Bardia NP in Nepal via the Khata corridor. The Girwa (Karnali) river and a major canal flow through this sanctuary, which is a part of the Dudhwa TR. Other areas of the sanctuary are disturbed because the narrow forest is bisected by a railway line and several roads. The major forest types found here are northern moist deciduous sal forest, northern dry plain sal forest, northern tropical dry deciduous sal forest, tropical seasonal swamp forest, low alluvial savannah, and moist sal savannah forests (WWF-India 2007).

Pilibhit Tiger Reserve (PTR) (28.866–28.767 °N, 79.916–82.250 °E) is spread over an area of 730.24 km² and is located in Pilibhit District of Uttar Pradesh, India. It is connected with the Terai-Bhabar forests of the Surai range of Terai East forest division in Uttarakhand in the north-west, Kishanpur WS in the south-east and Shuklaphanta NP in Nepal in the north. PTR supports a mosaic of dry and moist deciduous, scrub savannah and alluvial grasslands (Anwar et al. 2010).

Valmiki Tiger Reserve (VTR) (area 901.2 km², 27.167–27.50 °N, 83.833–84.167 °E) is located in the West Champaran district of Bihar in the eastern part of Terai-Arc landscape and the west by the Gandak River. It is contiguous with Nepal's Chitwan NP in the north, sharing a boundary of ~100 km along which is forested habitat. VTR's elevation ranges between 140 m and 874 m. Vegetation is represented by the bhabar dun sal forest, dry Shivalik sal forest, western Gangetic moist mixed deciduous forest, Khair-sissoo forest, cane brakes, eastern wet alluvial grassland, and Barringtonia swamp forest (Champion & Seth 1968; Maurya & Borah 2013) which makes it one of the 16 important bird area (IBA) in Bihar (Rahmani et al. 2016).

Udaipur Wildlife Sanctuary (UWS) (26.778–26.820 °N, 84.406–84.454 °E) encompassing an area of 887.35 ha of forest land is situated in the West Champaran district of Bihar, 50–60 km south to VTR. The unique feature of UWS is its being a forested wetland. The sanctuary has 'Saraiyaman Lake', an IBA (Rahmani et al. 2016). The vegetation is represented by mixed deciduous forest, riverine forest dominated by *Syzygium cumini*, plantation, grasslands, and aquatic vegetation.

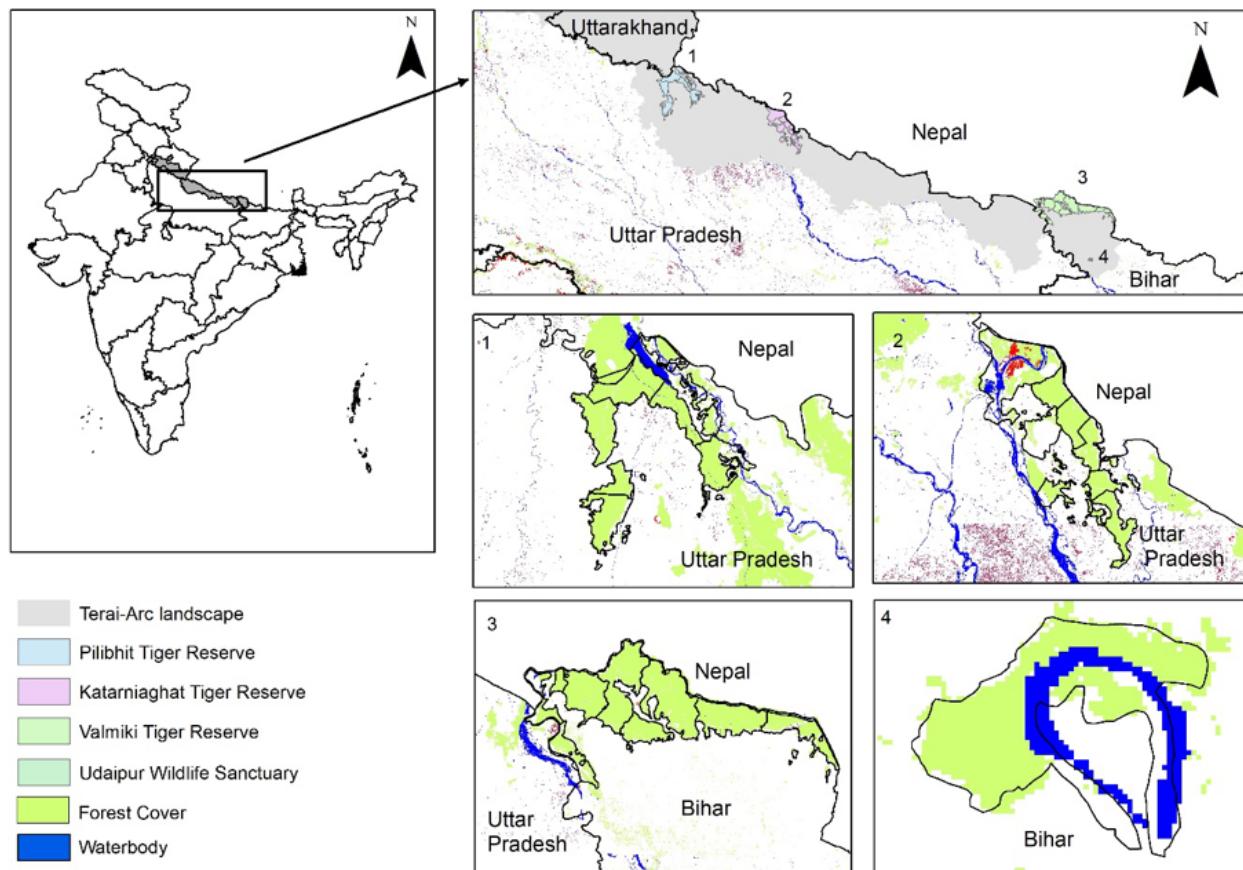

Figure 1. Map of study areas in Terai Arc landscape, India.

METHODS

Birds were recorded traversing trail and road transects in PTR (between March and May 2014, February and May 2015); and KWS (during 2001–2004, 2006, 2008, and 2015) (MacKinnon & Phillips 1993). In VTR, birds were recorded randomly during camera traps exercises and while travelling within the forests between 2014 and 2017. Birds of UWS were surveyed between 17 and 19 February 2018 for terrestrial birds (MacKinnon & Phillips 1993) and the total count method for water birds. Species photo-captured in camera traps (used for tiger census) were also included to compile the species list of each protected area.

MacKinnon's species richness was used for terrestrial species enumeration. One km long linear transects were laid in/along various habitats viz. woodland (sal, sal-mixed, moist riverine, dry riverine, teak plantation), water body (river and streams), grassland, barren land, and scrubland. On each transect, a list of 20 different species in KWS, PTR, and VTR, while a list of 15 species in UWS was generated traversing slowly at a speed of

0.5 km/hr. Once a list was completed, another list was prepared. No species was recorded more than once in each list. A total of 266 lists in KWS, 108 lists in PTR, 58 lists in VTR, and 18 lists in UWS were prepared. Birds were surveyed between 0700 h and 1000 h in the morning and 1600 h to 1900 h in the evening. All the bird species identified by sight or calls were recorded along with their number. Only confirmed identified bird species were included in the study.

The total count method was used to determine the richness of water birds. Species were recorded along with their number from morning hours till noon (0700–1200 h). Since it was not possible to cover the entire 'Saraiyaman Lake' from a single point, birds were counted by selecting more than one point. The survey was not conducted during adverse climatic conditions like rain and cloudy days. Bird species recorded were classified into various feeding guilds and migratory status based on the diet descriptions available (Ali & Ripley 1987; Grimmett et al. 2011). Sorenson's similarity index was used to calculate the similarity between bird species in different study sites using the following formula:

$S = 2C/A+B$, where,

C—common species between the sites | A—total number of species in site A | B—total number of species in site B.

RESULTS AND DISCUSSION

A checklist of 424 species; 298 terrestrial, 82 water birds, and 44 water-associated ones representing 20 orders and 78 families was compiled from four PAs of the Terai-Arc landscape (Table 1). The diversity of birds might be underestimated because some may have been missed due to their cryptic nature and observer inattention. The total bird species compiled from PAs of Terai-Arc Landscape represents around 30% of the Indian Subcontinent (Praveen et al. 2019) and 47% of the Indian Himalaya (Mandal et al. 2018) indicating that Terai-Arc landscape as among the most avifaunal diverse regions of India. The Terai-Arc landscape is located at the confluence of the Himalaya and Gangetic plains (Rodger & Panwar 1988) and hence supports species of both biogeographic zones.

The richness of species was observed maximum in KWS (n=358), followed by VTR (n = 306), PTR (n = 236), and UWS (n = 128, Table 2). The high richness of birds in KWS may be attributed to the structural complexity and diverse habitat that offer foraging and nesting opportunities to birds (Tews et al. 2004; Ahmed et al. 2019). Moreover, the Terai-Arc landscape is a mosaic of diverse habitat types; sal-forest, sal-mixed forest, dry riverine forest, moist riverine forest, grassland, scrubland, open lands, and wetlands and rivers (Chanchani et al. 2014). Benton et al. (2003) highlighted a heterogeneous landscape is likely to support more species owing to the (a) specialization of various resources and, (b) reduced competition between species (Fahrig et al. 2011) and landscape complementation (Dunning et al. 1992).

The earlier comprehensive study in KWS, conducted by Kalam (2005), reported 154 species, while Sethy & Chauhan (2011) documented 200 species. We report 358 species in KWS, of which 148 species were common with those of Kalam (2005), and 173 species with Sethy & Chauhan (2011). The present study didn't record six species such as Drongo Cuckoo *Surniculus lugubris*, Wallcreeper *Tichodroma muraria*, and Eurasian Blackbird *Turdus merula* reported earlier by Kalam (2005) and 21 species by Sethy & Chauhan (2011). These include Lesser Cuckoo *Cuculus poliocephalus*, Common Flameback *Dinopium javanense*, Red-headed Trogon *Harpactes erythrocephalus*, Rosy Minivet *Pericrocotus*

roseus, Red-headed Finch *Amadina erythrocephala* and Caspian Tern *Hydroprogne caspia*.

In VTR, an earlier study conducted by Choudhary (2016) has reported 246 species. Of these, 205 were found common with the present study (n = 306). There are 40 bird species such as Amur Falcon *Falco amurensis*, Vernal Hanging-Parrot *Loriculus vernalis*, Red-breasted Parakeet *Psittacula alexandri*, and Plumbeous Redstart *Rhyacornis fuliginosa* reported by Choudhary (2016) that we didn't report. We recorded 101 different species which were not observed in the earlier study by Choudhary (2016).

In PTR and UWS, no scientific studies have been carried out so far. However, records in the management plan of UWS report 91 species, of which, 89 were common with the present study (n = 128).

Significant records: Threatened Species

Among the species recorded (n = 424), 19 (CR: 6, EN: 5, VU: 8) species were globally threatened and 19 species were near threatened (Table 2, IUCN 2018). The critically endangered (CR) species recorded during the survey were White-rumped Vulture *Gyps bengalensis*, Indian Vulture *Gyps indicus*, Slender-billed Vulture *Gyps tenuirostris*, Red-headed Vulture *Sarcogyps calvus*, Bengal Florican *Houbaropsis bengalensis* and Yellow-breasted Bunting *Emberiza aureola* (IUCN 2018). The sightings of threatened birds are enumerated below:

Vultures

Seven species of vultures: White-rumped Vulture (WRV), Indian Vulture (IV), Slender-billed Vulture (SBV), Red-headed Vulture (RHV), Egyptian Vulture *Neophron percnopterus* (EV), Himalayan Vulture *Gyps himalayensis* (HV) and Griffon Vulture *Gyps fulvus* (GV) were recorded from the PAs of Terai-Arc Landscape. In KWS, a flock of 155 individuals consisting of WRV (n = 152) and IV (n = 3) was sighted feeding on a cattle carcass near Bichia village in 2001. Besides, 32 active nests of WRV were found along the Girwa River. During March 2016, a mixed flock of HV, WRV, and SBV was sighted feeding on carcasses between Dhakerwa town and Bichia market near Katerniaghata WS. In VTR, a mixed flock of WRV and IV were sighted feeding on carcasses in the Harnatand range (36 individuals), perching on a *Bombax ceiba* tree in Valmiki Nagar Range (RHV: 1, HV: 2), and flying over Ganauli range (EV: 1).

Pallas's Fish Eagle *Haliaeetus leucoryphus*

Endangered. In KWS, an active nest of Pallas's Fish Eagle was recorded near Girija Barrage during 2001–

Habitat type: GL—Grassland | AGR—Agricultural grassland | WGL—Wooded grassland | ML—Marshland | SF—Sal forest | MF—Mixed forest | RF—Riverine forest | WL—Wetland | RB—Riverbank | DG—Degraded.

Numerals represent year of sightings in study areas.

IUCN Red List status: CR—Critically Endangered | EN—Endangered | NT—Near Threatened | LC—Least Concern | VU—Vulnerable.

Status in PAs: R—Resident | WV—Winter visitor | SV—Summer visitor | LM—Local migrant | PM—Passage migrant | UC—Uncertain | VA—Vagrant.

2002. An individual was also sighted in February 2016 between Naughat and the watch tower in Katerniaghāt range of KWS. And another individual near Koleshwār mandir on the bank of Gandak river in VTR during March 2017.

Steppe Eagle *Aquila nipalensis*

Endangered. Steppe eagle was seen regularly during winters in the woodland of Valmiki Nagar and Ganauli ranges of VTR between 2014 and 2017 (Image 1). The species was also sighted twice near the Bhikna thori area in the Manguraha range of VTR during the later part of December 2017.

Greater Spotted Eagle *Clanga clanga*

Vulnerable. A single bird was observed twice in the winter on the banks of Gandak River in Valmikinagar range of VTR in the last week of December 2016.

Bengal Florican *Houbaropsis bengalensis*

Critically Endangered. In PTR, a male Bengal Florican was sighted in Chaugebi grassland, Mahof range during April 2014. This species is considered as one of the most endangered bustards of the world. In Uttar Pradesh, the recorded estimated population of this species was 22 individuals (Sivakumar et al. 2014). Javed & Rahmani (1998) expected the possible occurrence of this species in KWS, however, no sighting of this species occurred during the survey. The patches of short grasses and mosaic of agriculture field throughout the terai is considered potential habitats for Bengal Florican.

Swamp Francolin *Ortygornis gularis*

Vulnerable and endemic to the Indian subcontinent, a small population is distributed along the foothills of

Image 1. Steppe Eagle. © Shariq Safi

the Himalayas in tall and swampy grasslands of Terai as well as the floodplains in northern India and Nepal. During the 2001 survey, the bird was sighted frequently on Bund road in Katerniaghāt range. A maximum of 12 individuals were sighted in marshy habitats around 4–5 km before Kailaspuri gate in KWS. However, no individual was sighted during 2015. Two individuals of Swamp Francolin were seen on 23 Dec 2016 in the swamp habitat of Madanpur range in VTR.

Indian Skimmer *Rynchops albicollis*

Endangered. Seven individuals of Indian Skimmer were observed flying over the Girwa River on 24 April 2015 in Katerniaghāt (Image 2). Earlier studies in the KWS have not highlighted the occurrence of this species (Kalam 2005; Sethy & Chauhan 2011; Rahmani et al. 2016). No sightings were reported from PTR, Dudhwa NP, and VTR.

White-eared Night Heron *Gorsachius magnificus*

Endangered. An immature female of White-eared Night Heron was photo-captured on 24 November 2016 in a camera trap deployed near a slow-flowing perennial rivulet surrounded by moist deciduous forest type in Raghia range of VTR (Image 3). The species was recorded for the first time in Indian subcontinent (Shafi et al. 2018). The species is very rare with only 250–999 mature individuals distributed over southern and eastern China and northeastern Vietnam (BirdLife International 2017).

Woolly-necked Stork *Ciconia episcopus*

Vulnerable. Except for Udaipur WS, Woolly-necked Stork was commonly sighted in groups of one to four individuals in and around the PAs (Image 4). In PTR, a single individual was sighted on 16 February 2014 in the Mala range and on Madhotanda road on 29 March 2016. In Katerniaghāt, two individuals were sighted on the bank of Girwa river near watch tower in Katerniaghāt range during March 2008 and four individuals in bhainsalot phanta (grassland) in Nishangada range during April 2008. In VTR, an individual of Woolly-necked Stork was sighted in Bhasahwa and Madrahwa ghat in the Madanpur range on 17 and 22 January 2017.

Lesser Adjutant *Leptoptilos javanicus*

Vulnerable. A group of 24 individuals was sighted in a crop field around 2 km from Madanpur forest rest house towards Bagaha road in VTR in February 2017. In KWS, three individuals of Lesser Adjutant were sighted on Banda road near Mantri Mod on 28 March 2006. Two individuals were recorded in Sujauli range while

Image 2. Indian Skimmer in Katerniaghata Wildlife Sanctuary. © Rohit Ravi.

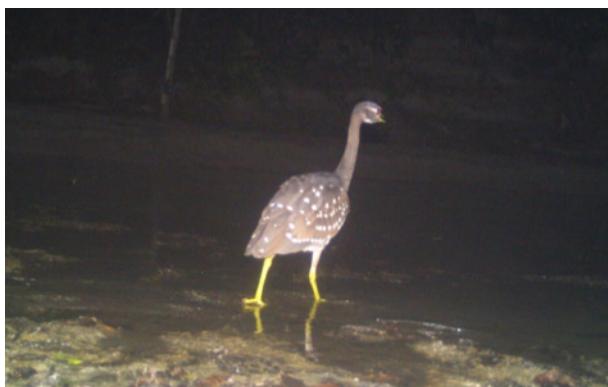

Image 3. White-eared Night Heron *Gorsachius magnificus* in VTR. © WWF-India/VTR.

Image 4. Woolly-necked Stork. © Shariq Safi.

deploying camera on 20 April 2015 and five individuals were seen perching on a tree in Mala range of PTR on 16 Feb 2014.

Spot-billed Pelican *Pelecanus philippensis*

Near Threatened. Six individuals of Spot-billed Pelican were sighted during the winters of 2001 in Girjapuri barrage in KWS. However, no individual was sighted during 2015–16 surveys in Katerniaghata.

Sarus Crane *Antigone antigone*

Vulnerable. A flock of six and four individuals was sighted in Garha corridor and near Richola chowki, Mala range respectively during 2014 in PTR. In VTR, a group of seven individuals was seen foraging in a crop field near Rampur check post in Madanpur range on 21 February 2017. Once common in Uttar Pradesh, Bihar, West Bengal, Assam, Rajasthan, Madhya Pradesh, and Gujarat, the population of this species is declining across its distribution range (BirdLife International 2016).

Great Slaty Woodpecker *Mulleripicus pulverulentus*

Vulnerable. An individual of Great Slaty Woodpecker was sighted in January 2004 near Gharial centre of Katerniaghata WS. In VTR, the species was sighted on two occasions; a group of three individuals in Gobardhana range during December 2017 and two individuals in Ganauli ranges during March 2017.

White-throated Bushchat *Saxicola insignis*

Vulnerable. Rare; two male individuals were observed on the railway track in Madanpur range of VTR in first week of February 2016.

Yellow-breasted bunting *Emberiza aureola*

Critically Endangered. This species was sighted in woody grassland patch of Katerniaghata range of KWS in December 2001. The presence of this species has also been highlighted from Dudhwa NP with uncertain status (Javed & Rahmani 1998), the migratory status of the species was doubtful in KWS too. However, it appears to be winter migrant in southeastern Asia including India

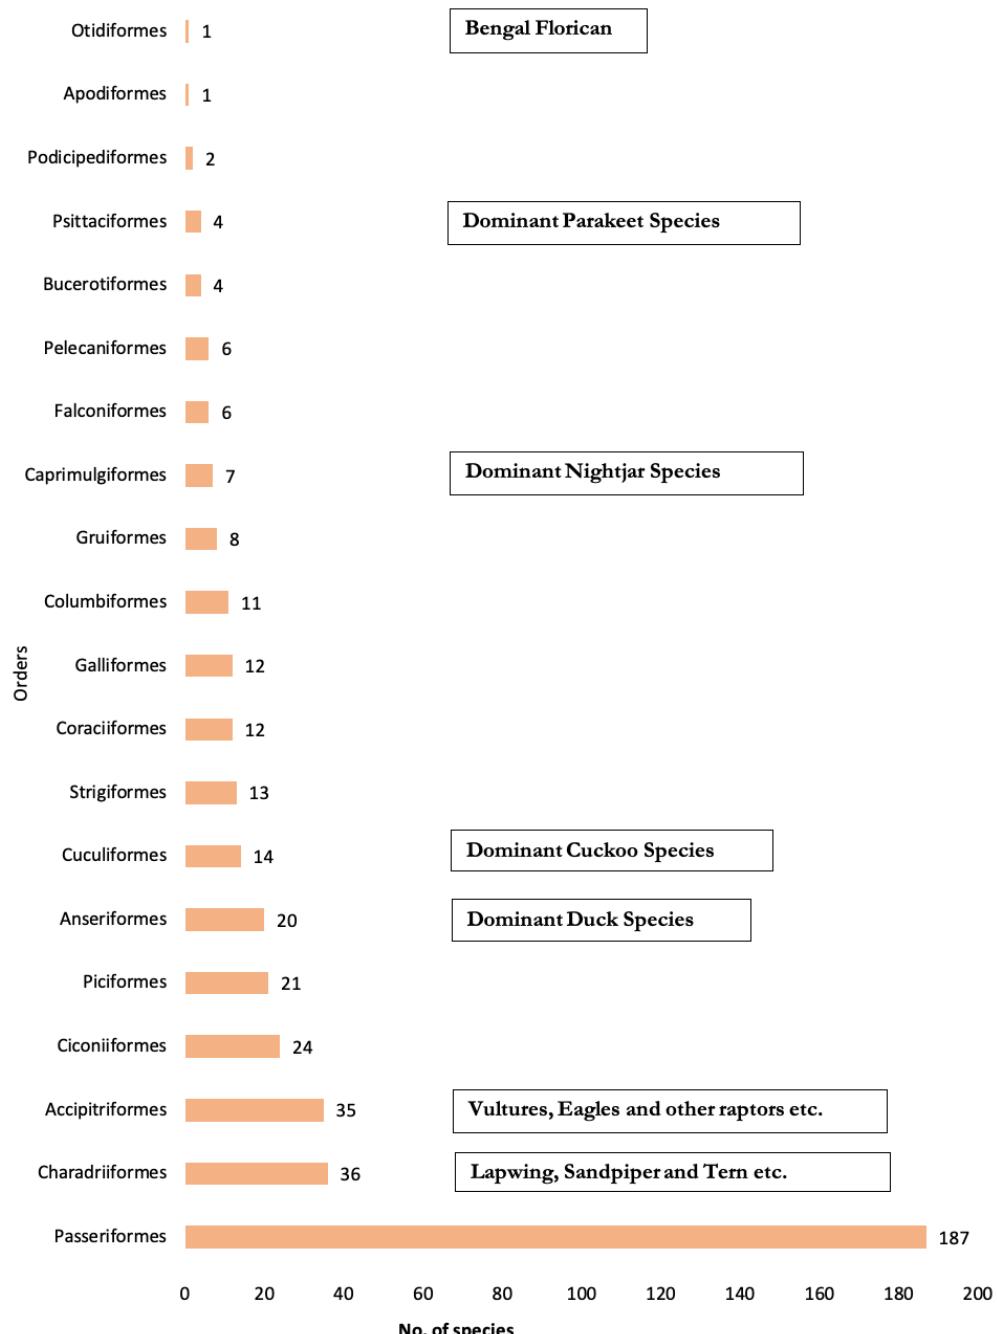

Figure 2. Order-wise richness of avian species observed in protected areas of Terai-Arc landscape, India.

(Grimmett et al. 2011).

An analysis of avian species composition between the PAs indicated KWS had a high similarity index value with PTR ($S = 0.77$) and VTR ($S = 0.74$, Table 3). PTR shared a high proportion of similar species with VTR ($S = 0.69$, Table 3). Avian community composition of UWS differ from rest of PAs; PTR ($S = 0.58$), KWS ($S = 0.50$), and VTR ($S = 0.50$). This might be related to the prevalence of similar habitat, i.e., woodland in Valmiki, Pilibhit and

Katerniaghata (Chanchani et al. 2014). Since majority of area of UWS is under wetland, hence different bird community structure could be expected.

Majority of the species in the region (187 species; 44.1%) belong to the order Passeriformes (Figure 2). The higher prevalence of Passeriformes in the Terai-Arc landscape is consistent with many other studies conducted in the other part of Terai-Arc landscape and elsewhere in India (Singh et al. 2013; Ahmed et al. 2015,

Table 2. IUCN Red List status of avian species recorded in four different protected areas of Terai-Arc landscape, India.

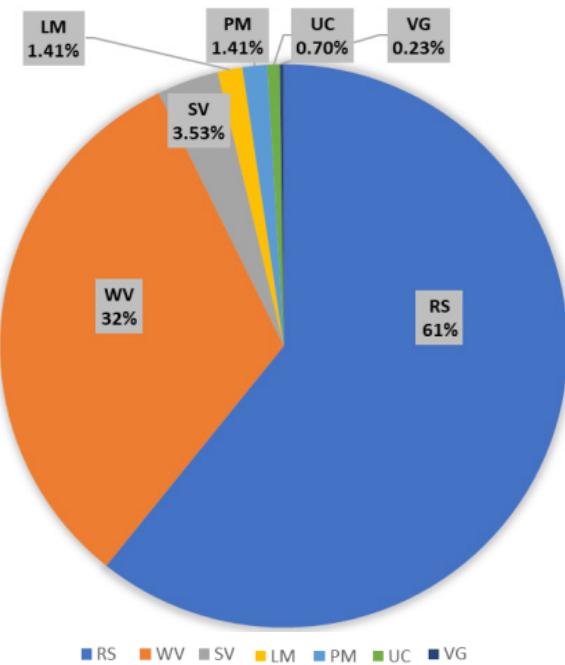

Protected area	Critically Endangered	Endangered	Vulnerable	Near Threatened	Least Concern	Total
Katerniaghats WS	5	4	6	18	325	358
Pilibhit TR	4	1	4	11	216	236
Valmiki TR	3	4	7	13	279	306
Udaipur WS	2	1	0	2	123	128
Overall	6	5	8	19	386	424

Table 3. Similarity in avian species between four protected areas of Terai-Arc landscape, India.

Protected area	Pilibhit TR	Valmiki TR	Udaipur WS
Katerniaghats WS	0.77	0.74	0.50
Pilibhit TR		0.69	0.58
Valmiki TR			0.50

2019). Family Accipitridae (34 species) dominated the region and it was followed by Muscicapidae (28 species) and Anatidae (20 species). Majority of the species such as Black Francolin, Red Spurfowl *Galloperdix spadicea*, Oriental Darter *Anhinga melanogaster*, Crested Serpent Eagle *Spilornis cheela*, Shikra *Accipiter badius*, and Common Hawk Cuckoo *Hierococcyx varius* were residents ($n = 258$, 60.8%) followed by winter visitors such as Bar-headed Goose *Anser indicus*, Ruddy Shelduck *Tadorna ferruginea*, Red-crested Pochard *Netta rufina*, and Osprey *Pandion haliaetus* ($n = 135$, 31.8%), summer visitors such as Pied Cuckoo *Clamator jacobinus*, Indian Cuckoo *Cuculus micropterus*, Large Cuckoo-shrike *Coracina macei*, and Indian Paradise-flycatcher *Terpsiphone paradisi* ($n = 15$, 3.53%) and local migrant such as Painted Stork *Mycteria leucocephala* and Black-headed Ibis *Threskiornis melanocephalus* ($n = 6$, 1.41%) and passage migrant like Indian Skimmer *Rynchops albicollis* and Rosy Starling *Pastor roseus* ($n = 6$, 1.41%). Three species with uncertain status, viz., Pale-chinned Blue Flycatcher *Cyornis poliogenys*, Little Spiderhunter *Arachnothera longirostra*, and Little Forktail *Enicurus scouleri* was recorded. One vagrant species viz. Great Grey Shrike *Lanius excubitor* was also recorded in the area (Figure 3).

Based on their food preferences, a majority of bird species (190 species, 44.8%) belonged to the insectivorous guild, followed by carnivores (88 species, 20.7%) and omnivores (70 species, 16.5%) (Figure 4). Nectivorous guild was the least represented guild in the region (10 species, 2.35%). The dominancy of insectivores has been observed in various regions of India (Sultana

**Figure 3.** Residential status of avian species recorded from protected areas of Terai-Arc landscape, India. (RS—Resident | WV—Winter Visitor | SV—Summer Visitor | LM—Local Migrant | PM—Passage Migrant | UC—Uncertain | VG—Vagrant).

& Khan 2000; Sultana et al. 2007; Aggarwal et al. 2008; Acharya et al. 2010; Joshi & Bhatt 2011; Ahmed et al. 2015). High tree density along with moist conditions favour richness and abundance of insects (Erwin 1982; Chettri et al. 2005). Since the study was carried out in PAs with high tree density (FSI 2019), hence dominancy of insectivorous species in Terai-Arc landscape could be expected.

Terai-Arc landscape is a biologically diverse eco-region and has been listed among the conservation landscapes of global importance for its unique Terai-Duar Savanna and Grassland habitats, which support more than 600 species of birds (Chanchani et al. 2014). Many Critically Endangered species were observed here during the study, showing the potential of the landscape as a good habitat for avifauna. The study will serve as

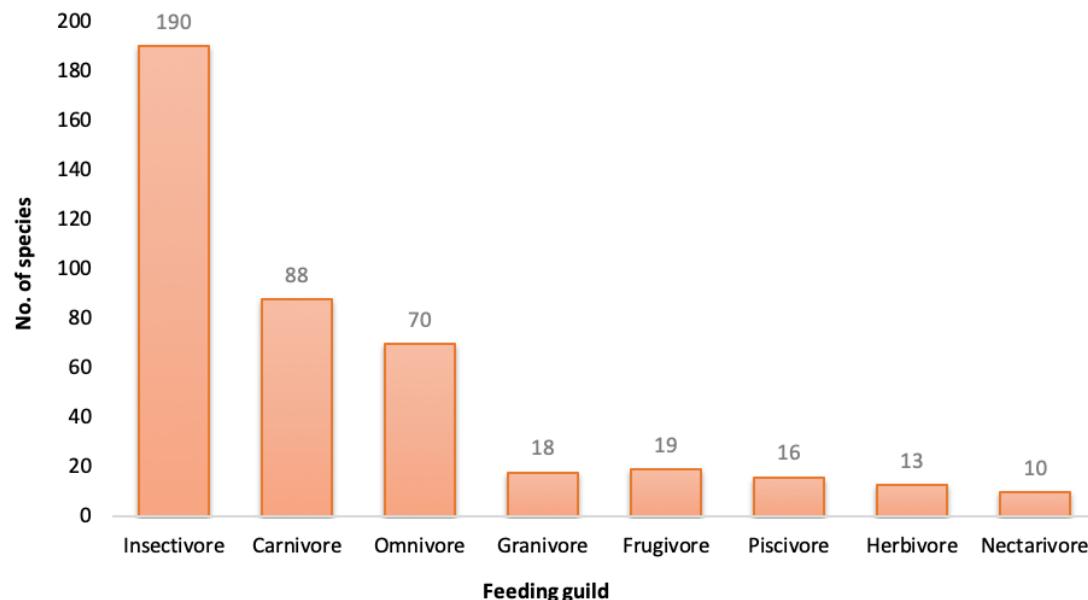

Figure 4. Avifaunal species in different feeding guilds recorded in protected areas of the Terai-Arc landscape, India.

baseline data for better management and conservation of the existing species. Further long-term studies in the landscape in different seasons are required to prepare a holistic checklist of birds found here as our study had limitations of being not continuous in all the mentioned PAs. Since the forest area in the landscape is surrounded by the rapidly increasing human population, which traditionally depends upon forest resources such as fuelwood, fodder, non-timber forest products and grazing, posing a serious threat to the habitats of the PAs (Wikramanayake et al. 2010). The presence of an all-weather road and railway track inside the KWS and VTR is leading to a high level of disturbance (Maurya & Borah 2013; Chanchani et al. 2014). Water bodies in KWS and UWLS are very important for water birds including waders, many winter visitors and local migrant species recorded here. Illegal fishing is one of the threats to water birds observed here (Chanchani et al. 2014). The infestation of grassland by *Lantana* spp. due to over-grazing and other human-induced disturbances, including fire as management practice, are among the major threats to the grassland ecosystems (Javed & Rahmani 1998). The present study reports nearly 19% species ($n = 80$) are dependent on grassland and grassland-associated habitats, therefore conservation of grassland with adequate scientific knowledge with proper monitoring plan is needed.

Author details: SHARIQ SAFI is presently employed as a technical assistant for field program at the Dept. of Wildlife Sciences, AMU. He has been actively engaged in the tiger conservation program and his research interests extend to studying lesser carnivores and bird populations both within and outside protected areas. TANVEER AHMED, PhD in landscape ecology from Aligarh Muslim University, is currently working as project coordinator at the Wildlife Institute of India, Dehradun. Dr Ahmed possesses extensive experience in studying aquatic and terrestrial birds and mammals of the Indian Trans-Himalaya and Terai-Arc landscape, and impact assessment of developmental projects, and river biodiversity assessment. JUNID NAZEER SHAH, PhD in wildlife sciences, specializes in biodiversity conservation in terrestrial and marine ecosystems. He is currently heading Ajaz Environment Consultants, carrying out projects across the Middle East. With over 20 years of experience, he has led projects across the Middle East, focusing on ecological compliance, EIA, and Coastal Zone Management. His expertise includes long-term monitoring of breeding bird species of global significance. MERAJ ANWAR, PhD in wildlife science from Wildlife Institute of India, Dehradun. His research focused extensively on wildlife corridors and population estimation of tigers and associated species, human-wildlife mitigation, radio-telemetry on tigers and avifaunal assemblage in the Terai Arc landscape. Currently, he is working as Coordinator for Species Conservation at WWF-India and based out in Haldwani, Uttarakhand. KAMLESH K. MAURYA, PhD, is landscape coordinator at WWF- India, and involved in field research on carnivores in India since 2005. His research interest includes population dynamic of carnivores and human-wildlife conflict in human dominated landscapes.

Articles

Unearthing calf burials among Asian Elephants *Elephas maximus* Linnaeus, 1758 (Mammalia: Proboscidea: Elephantidae) in northern Bengal, India

– Parveen Kaswan & Akashdeep Roy, Pp. 24615–24629

Coexistence of Indian Pangolin *Manis crassicaudata* (Geoffroy, 1803) (Mammalia: Pholidota: Manidae) and Indian Crested Porcupine *Hystrix indica* (Kerr, 1792) (Mammalia: Rodentia: Hystricidae) in Purulia District, West Bengal, India

– Debosmita Sikdar, Shwetadri Bhandari & Sanjay Paire, Pp. 24630–24645

Avifaunal assemblage patterns in Bharathapuzha River Basin, Kerala, India

– Pazhayattuparambil Narayanan Anoop Raj, Avadhoot Dilip Velankar & Padmanabhan Pramod, Pp. 24646–24657

Desmids of Brahmaputra valley, a major southern Asian river basin

– Soumin Nath & Partha Pratim Baruah, Pp. 24658–24693

Communications

Distribution status and roost characteristics of Indian Flying Fox *Pteropus medius* Temminck, 1825 (Mammalia: Chiroptera: Pteropodidae) in Kurukshetra district, Haryana, India

– Ritu Devi & Parmesh Kumar, Pp. 24694–24706

Avifauna of four protected areas of Terai-Arc Landscape, India: significant records and a checklist of species

– Shariq Safi, Tanveer Ahmed, Junid Nazeer Shah, Meraj Anwar & Kamlesh K. Maurya, Pp. 24707–24729

Monitoring observations of the southernmost breeding population of Long-billed Vultures *Gyps indicus* (Scopoli, 1786) (Aves: Accipitriformes: Accipitridae) in the Nilgiri Biosphere Reserve, India

– S. Manigandan, H. Byju & P. Kannan, Pp. 24730–24736

Observations on Indian Skimmer *Rynchops albicollis* Swainson, 1838 (Aves: Charadriiformes: Laridae) breeding colonies in Middle Ganges stretch, India

Kumar Ankit, Mujahid Ahamad, Vivek Ranjan, Sanjay Kumar, Syed Ainul Hussain & Govindan Veeraswami Gopi, Pp. 24737–24745

Avifaunal diversity in urban greenspaces within Cotabato city, Mindanao Island, Philippines

– Joan Rhea Mae L. Baes, Peter Jan D. de Vera, John Paul A. Catipay, Marian Dara T. Tagoon & Elsa May Delima-Baron, Pp. 24746–24751

Waterbird count at Narathali waterbody, Buxa Tiger Reserve in northern Bengal for a decade (2009–2019) with a note on raptors

– Sachin Ranade & Soumya Sundar Chakraborty, Pp. 24752–24759

ISSN 0974-7907 (Online) | ISSN 0974-7893 (Print)

February 2024 | Vol. 16 | No. 2 | Pages: 24615–24818

Date of Publication: 26 February 2024 (Online & Print)

DOI: 10.11609/jott.2024.16.2.24615-24818

First confirmed reproduction by a translocated female Siamese Crocodile *Crocodylus siamensis* (Crocodylidae: Crocodilia) with observations of nest attendance and nest-associated fauna

– Steven G. Platt, Sounantha Boutxakittilath, Oudomxay Thongsavath, Samuel C. Leslie, Lonnie D. McCaskill, Randeep Singh & Thomas R. Rainwater, Pp. 24760–24768

Erode Ground Gecko *Cyrtodactylus speciosus* (Beddome, 1870) (Squamata: Gekkonidae) from peri-urban common-lands of Coimbatore, India, with comments on habitat associations

– S.R. Ganesh, N.A. Swaathi & Usha Ravindra, Pp. 24769–24774

Assessment of diversity of Odonata fauna in selected sites of Purba Bardhaman district, West Bengal, India

– Sulagna Mukherjee & Rabindranath Mandal, Pp. 24775–24785

A preliminary assessment of butterfly diversity from Mekhliganj town, Cooch Behar District, West Bengal, India

– Abhirup Saha, Prapti Das & Dhiraj Saha, Pp. 24786–24794

Utilization of *Afzelia africana* Sm. ex Pers. (Magnoliopsida: Fabales: Fabaceae) in Nigeria and its implications for conservation

– Samuel Oloruntoba Bamigboye, Muhalil Olaide Jimoh, Falilat Abeni Lawal, Zainab Temitope Osiyemi, Charles Petrus Laubscher & Learnmore Kambizi, Pp. 24795–24803

Short Communications

Gastrointestinal parasites of the Indian Flying Fox *Pteropus medius* in Nagpur City: a seasonal study through faecal sample analysis

– Ruchika R. Sangale & Priya Gawande, Pp. 24804–24806

***Plagiochila javanica* (Sw.) Nees & Mont. (Marchantiophyta: Plagiochilaceae) rediscovered from the Western Ghats after 180 years**

– M.S. Sajitha, C.N. Manju, B. Mufeed, K.P. Rajesh & K.K. Rawat, Pp. 24807–24811

A new record of genus *Synedrus* Graham, 1956 with description of male of *Synedrus kasparyani* Tselikh, 2013 from India

– Mubashir Rashid & Arvind Kumar, Pp. 24812–24815

Note

***Hunteria zeylanica* (Retz.) Gardner ex Thwaites (Magnoliopsida: Gentianales: Apocynaceae)—new addition and first genus record to the flora of Karnataka**

– G. Ramachandra Rao, Pp. 24816–24818
